Infeasible Bug P2 + Add Hotlist Reviewed (L1)

STATUS UPDATE No update yet. Edit

DESCRIPTION fr...@gmail.com created issue #1

My app works fine if the profiler is not active.

If it is active, it will hang on startup if I have "Start recording CPU activity on startup" checked in the Profiling configuration.

If I don't have this checked, it will crash when launching an activity from within the app.

I am targeting SDK 28 but running on SDK 26 (Samsung S7 Edge).

With the CPU recording going (causes hang), my own Thread.UncaughtExceptionHandler caught this:

InTouch - 150: Lifecycle: logging uncaught exception in build Build: 1.0000.00102 from Thread: main, exception was: EnsureLocalCapacity at: java.io.FileInputStream (FileInputStream.java: -1 android.graphics.Typeface (Typeface.java: 1220) at: android.graphics.Typeface (Typeface.java: 1413) at: android.graphics.Typeface (Typeface.java: 1549) at: android.app.Activity (Activity.java: 1 androidix.fragment.app.FragmentActivity (FragmentActivity.java: 313) at: androidix.appcompat.app.AppCompatActivity (AppCompatActivity.java: 106) at: com.reddragon.intouch.ui.DetailActivity ( (ActivityThread.java: 2910) at: android.app.ActivityThread (ActivityThread.java: 3032) at: android.app.ActivityThread (null: 0) at: android.app.ActivityThread\$H (ActivityThread.java: 1696) at: andr (Method.java: -2) at: com.android.internal.os.Zygote\$MethodAndArgsCaller (Zygote.java: 327) at: com.android.internal.os.ZygoteInit (ZygoteInit.java: 1374)

Logcat shows:

Btw - I am using Android Studio 3.6 RC 1

 **vi...@google.com** <vi...@google.com> [#3](#)

Assigned to fr...@gmail.com.

Can you please help share the idea.log file (select Help > Show Log in Finder) if this issue reproduces again? Thank you very much!

 **fr...@gmail.com** <fr...@gmail.com> [#4](#)

Attached is a recent output from this afternoon where the same error occurred.

Btw - I notice this defect got changed from a P2 to P3 in priority, and from a S2 to S3 in severity. The issue I'm experiencing renders CPU profiling inoperable, so I wouldn't consider this either

Hi, thank you for reporting this issue!  
In order to triage this bug, we need more information from you:  
- Does the crash happen every time when you profile the app?  
- Can you share the logcat when this crash happens (i.e. when start-up recording is not enabled)?  
- Do you remember which recording configuration were you using (e.g. sample java, c/c++, system tracing)?  
- Have you tried on another device, or emulator (e.g. Pixel emulator)?  
- If you could share a sample project, that would greatly help us reproduce the issue? We can share the files over Google Drive confidentially.  
Thanks!

 **fr...@gmail.com** <fr...@gmail.com> [#7](#)

Hi -

I have upgraded to AS 3.6 RC2.

Now if I don't have "Start recording CPU activity on startup" checked, then I don't experience the crash.

However if I do have this checked, and "Sample Java Methods" selected, my app "hangs" (not exactly a crash). From logcat, it appears that something continues to wait for threads to suspen

I tried running this on a Nexus 5X using API 28 and got this error trying to launch the profiler:

```
java.lang.NullPointerException
    at com.android.tools.profilers.cpu.CpuProfilerStage.startCapturing(CpuProfilerStage.java:461)

```

I also tried using the Pixel 2 emulator, but it seems even when I launch the app using the profiler icon at the top of the AS window, it doesn't attach to that process. I've attached to screenshots

```

Thanks for the logs!

- Just to confirm, if you don't enable start-up recording and just profile the app, it works fine. Correct?
  - When you tried Pixel 2 emulator, was it after the Nexus 5X exception? If so the profilers may be in a corrupt state so can you try again from a clean state?
  - The log from Samsung S7 Edge doesn't show anything related to profiler. What did you see when it hung? Did you see any data in the profiler window?
  - Another thing I'd like you to try is switch recording configuration to Sample C/C++ Functions or Trace System Calls and see if still hangs.
- Thank you again!

fr...@gmail.com <fr...@gmail.com> [#9](#)

Correct - without enabling start-up recording I am not getting the crash I was previously.

Yes it was after trying the Nexus 5x that I tried the Pixel 2. So I rebooted AS, and changed the recording config to Trace System Calls. This seemed to work, see attached image. I did notice th

I also notice that after I stopped the emulator, and shut it down, then switched the app to use the samsung, clicking on the "Profile 'app'" button in the toolbar launches the app n the Samsung

so I rebooted AS, then selected the profiler button again (with the samsung chosen as the device). The profiler window launched properly this time, and it did not hang. I've attached two other app and stopped recording (screen has not refreshed to correctly show the recording type in both places.

So now I went back and changed it back to "Sample Java Methods", and I once again got the hang. Logcat output is:

When the profiler is working correctly, I don't see any "Timed out waiting for threads to suspend" messages. I can tell where it hangs it is stuck doing an online check against my website using

Btw - I also tried using "Trace Java Methods" and initially got the same hanging problem, then I realized I hadn't copied the logcat info, so I rebooted AS and tried again. This time I was able to

Thank you for the trying all the different steps. Just curious, does the hang happen when you perform a regular Sample Java Methods recording, not from start-up?  
Yes it would help us if you could share a sample project with this issue because I can't seem to reproduce this. Thanks again!

 **fr...@gmail.com** <fr...@gmail.com> [#11](#)

I'm not sure what you mean by "regular Sample Java Methods recording, not from start-up". Should I be able to "attach" the profiler to a running instance of the app? I am trying to do this from  
  
I will try tonight to see if I can narrow this down into a project I can send you.  
  
T

 **yi...@google.com** <yi...@google.com> [#12](#)

First disable start-up recording (since that will cause a hang), then press Profile to profile your app and press Record in the CPU profiler to start a Sample Java Methods recording.

 **fr...@gmail.com** <fr...@gmail.com> [#13](#)

That works with no hanging!

So I will see if I can find a way to reproduce the hang on startup in a small test app.

I think since where it gets hung up is trying to suspend threads at the very beginning, there must be some thread execution in the startup activity that is causing this. In the actual app I do ha

 **fr...@gmail.com** <fr...@gmail.com> [#14](#)

So I created a small project where I have attempted to mimic all the threading on startup that happens in the real app. But I don't get the same behavior - the test app seems to start properly.  
  
In the real app, the hang occurs it appears because the profiler is attempting to suspend all threads and can not. Is there a way I can find out which thread is not able to be suspended?

 **yi...@google.com** <yi...@google.com> [#15](#)

Hi,  
In order for us to isolate the issue, can you try running the following profiling command and make sure Android Studio is NOT running.  
1. Start your app from the phone  
2. Immediately run this command during app start-up: adb shell am profile start --sampling 500 --streaming [your app id, e.g. com.example.yourapp] /data/local/tmp/art.trace

See if the app hangs or crashes.  
Either way run this command to stop profiling: adb shell am profile stop [your app id]

Since you mentioned it only happens during app start-up, you might need to try a couple of times to get the timing right. Let me know if you still see any crashes/hangs.

Thank you for helping!

```
adb forward tcp:1234 tcp:1234
adb shell pidof <your_app_id>
```

Copy the number that's printed out by pidof

```
adb shell run-as <your_app_id> gdbserver64 --attach localhost:1234 <pid printed out by above command>
```

Then in another shell run:

```
gdb -q --eval-command="set confirm off" --eval-command="target remote localhost:1234" --eval-command="info thread" --eval-command="thread apply all where"
```

Let me make sure I completely understand the sequence:

reboot both the phone and the laptop running AS

Start AS

open up two command shells

Start the app with the profiler from AS that causes the hang

When it hangs, then use the first shell to get the pid of the app using the first two adb commands, and copy the PID number

Use that same shell to run the gdbserver command

Then in another shell run the gdb command.

Copy the logcat, output of the commands and the backtraces.txt files to you.

Right?

**al...@google.com** <al...@google.com> [#26](#)

Ok for some reason we decided not to include gdbserver on user-builds so you need to get it from the ndk. That's why it didn't work for you. You seem to understand what you need to do corr

Please download the ndk for your platform (windows I guess) from here: <https://developer.android.com/ndk/downloads>

Unzip the file and run the following commands:

```
adb reboot
adb push /path/to/ndk/unzipped/android-ndk-r21/prebuilt/android-arm64/gdbserver/gdbserver /data/local/tmp/gdbserver-ndk
adb shell run-as <app-id> cp /data/local/tmp/gdbserver-ndk gdbserver-ndk
adb shell run-as <app-id> chmod 755 gdbserver-ndk
adb forward tcp:1234 tcp:1234
adb shell pidof <app-id>
adb shell run-as <app-id> ./gdbserver-ndk --attach localhost:1234 <pid printed out by above command>
```

Then in another shell run:

```
gdb -q --eval-command="set confirm off" --eval-command="target remote localhost:1234" --eval-command="info thread" --eval-command="thread apply all where"
```

then upload backtraces.txt and any other output.

**fr...@gmail.com** <fr...@gmail.com> [#27](#)

```

```
C:\Users\frysingg>
```

**fr...@gmail.com** <fr...@gmail.com> [#28](#)

Our messages crossed - let me try getting it from the NDK and try again.

**al...@google.com** <al...@google.com> [#29](#)

Please try the commands from comment #26

**fr...@gmail.com** <fr...@gmail.com> [#30](#)

I started executing the commands, got this:

```
C:\Users\frysingg>adb push C:/BLD/android-ndk-r21/prebuilt/android-arm64/gdbserver/gdbserver /data/local/tmp/gdbserver-ndk
C:/BLD/android-ndk-r21/prebuilt/android-arm64/gdbserver/gdbserver: 1 file pushed. 15.6 MB/s (1347800 bytes in 0.082s)
```

```
C:\Users\frysingg>adb shell run-as com.reddragon.intouch cp /data/local/tmp/gdbserver-ndk gdbserver-ndk
```

```
C:\Users\frysingg>adb shell run-as com.reddragon.intouch chmod 755 gdbserver-ndk
```

```
C:\Users\frysingg>adb forward tcp:1234 tcp:1234
1234
```

```
C:\Users\frysingg>adb shell pidof com.reddragon.intouch
19178
```

```
C:\Users\frysiing>adb shell run-as com.reddragon.intouch ./gdbserver-ndk --attach localhost:1234 19178
Can't open socket: Permission denied.
Exiting
```

**yi...@google.com** <yi...@google.com> [#31](#)

Looks like gdbserver doesn't have internet permission. Can you add those permissions to your app if they're not already there?  
If that still doesn't work can you use these commands to grant permissions:  
adb shell pm grant com.name.app android.permission.INTERNET  
adb shell pm grant com.name.app android.permission.ACCESS\_NETWORK\_STATE

**fr...@gmail.com** <fr...@gmail.com> [#32](#)

My app has both those permissions set already, but I will try the adb shell alternatives.  
  
I do have a firewall set up (corporate mandate), maybe port 1234 is in a range that is blocked somehow?

**al...@google.com** <al...@google.com> [#33](#)

That might be true. Maybe try a higher port number.

**yi...@google.com** <yi...@google.com> [#34](#)

Yeah that could be it. Try a different port. Use netstat -abno on Windows to see ports in use and avoid those.

**fr...@gmail.com** <fr...@gmail.com> [#35](#)

I couldn't execute the permission commands, I got:  
  
adb shell pm grant com.reddragon.intouch android.permission.ACCESS\_NETWORK\_STATE  
Operation not allowed: java.lang.SecurityException: Permission android.permission.ACCESS\_NETWORK\_STATE is not a changeable permission type

**fr...@gmail.com** <fr...@gmail.com> [#36](#)

It seems that no matter what socket I try, I get a "permssion denied". Interestingly, when I did the netstat after the first try, I did see TCP:1234 with a status of "listening". So maybe there is so access the port for some reason?

**al...@google.com** <al...@google.com> [#37](#)

Ok try these commands to setup the gdbserver:

```
adb reboot
adb push /path/to/ndk/unzipped/android-ndk-r21/prebuilt/android-arm64/gdbserver/gdbserver /data/local/tmp/gdbserver-ndk
adb shell run-as <app-id> cp /data/local/tmp/gdbserver-ndk gdbserver-ndk
adb shell run-as <app-id> chmod 755 gdbserver-ndk
adb shell run-as <app-id> pwd
```

copy the output of this pwd command. It will be something like /data/user/0/com.reddragon.intouch probably.

```
adb shell run-as <app-id> chmod a+x <output of pwd>
adb forward tcp:1234 localfilesystem:<output of pwd>/mysocket
adb shell pidof <app-id>
adb shell run-as <app-id> ./gdbserver-ndk --attach +<output of pwd>/mysocket <pid printed out by above command>
```

Then in another shell run:

```
gdb -q --eval-command="set confirm off" --eval-command="target remote localhost:1234" --eval-command="info thread" --eval-command="thread apply all where"
```

**fr...@gmail.com** <fr...@gmail.com> [#38](#)

OK - got a lot further. The first shell all looked like it went ok. But trying to execute in the second shell I got:

```
C:\Users\frysiing>gdb -q --eval-command="set confirm off" --eval-command="target remote localhost:1234" --eval-command="info thread" --eval-command="thread apply all where" --eval-cor
C:\BLD\android-ndk-r21\prebuilt\windows-x86_64\bin\gdb-orig.exe: warning: Couldn't determine a path for the index cache directory.
Excess command line arguments ignored. (remote ...)
confirm: No such file or directory.
C:\Users\frysiing>off: No such file or directory.
Argument required (expression to compute).
No thread selected
```

What next?

**al...@google.com** <al...@google.com> [#39](#)

Try running in the second shell

```
gdb-orig -q --eval-command="set confirm off" --eval-command="target remote localhost:1234" --eval-command="info thread" --eval-command="thread apply all v
```

Also try running it using powershell instead of cmd.

**fr...@gmail.com** <fr...@gmail.com> [#40](#)

I actually did try that but got an error about Python not being set up correctly..?

**fr...@gmail.com** <fr...@gmail.com> [#41](#)

Specifically, if I attempt to execute gdb-orig in cmd or power shell, I get:

```
PS C:\Users\frysingg> gdb-orig
Could not find platform independent libraries <prefix>
Could not find platform dependent libraries <exec_prefix>
Consider setting $PYTHONHOME to <prefix>[:<exec_prefix>]
ImportError: No module named site
```

**al...@google.com** <al...@google.com> [#42](#)

Do you happen to have a mac or linux computer you could do this on (the same commands should work). It doesn't matter if your source code isn't on the computer. All the information is on  
If not then just run `gdb` directly and enter the following commands 1 at a time into the gdb prompt, copying the output (there will be 100s of lines).

```
set confirm off
set pagination off
target remote localhost:1234
info thread
thread apply all where
```

Once you have copied all the output run `quit` in the gdb prompt to close the program.

**fr...@gmail.com** <fr...@gmail.com> [#43](#)

Just performed all instructions within powershell and got the same results as above.

**fr...@gmail.com** <fr...@gmail.com> [#44](#)

OK - that last approach worked! Here are two files, a logcat dump and the thread dump.

 **logcat.txt**  
89 KB [View](#) [Download](#)

 **threaddump.txt**  
238 KB [View](#) [Download](#)

**yi...@google.com** <yi...@google.com> [#45](#)

Thank you! Our messages crossed again (I sent you a DM offline). We'll look at the logs.

**al...@google.com** <al...@google.com> [#46](#)

Some things that immediately jump out:

Threads 31 - 39 are in `libjvmtiagent_arm64.so` code but don't seem to have been started from `RunAgentThread`. This probably isn't an issue though since the threads must have either called /  
Thread 49 is in the middle of a class-prepare initiated by the jvmti agent itself. @Yiyang can you try to figure out what your agent is actually doing here?

```

Unfortunately it's not clear what thread is stuck in runnable (or if none of them are and this is a bug in suspendAll).

frysingertad: please setup the gdbserver as described in comment #37 and run the following gdb commands and post the output:

```
set confirm off
set pagination off
target remote localhost:1234
info thread
info address art::Thread::CurrentFromGdb
```

This last command will print something like Symbol "art::Thread::CurrentFromGdb" is at 0x77e4d10130 in a file compiled without debugging. copy the entire hex pointer (0x

```
set $get_thread=<value copied from last command>
thread apply all p (((unsigned short*)(*))$get_thread())[1]
thread apply all where
```

This should give us an idea of what the runtime thinks all the threads are doing and narrow down where we should be looking.

yi...@google.com <yi...@google.com> [#47](#)

What Thread 49 is doing is: on every class prepare callback, live allocation tracking acquires a mutex before sending the allocation meta data to an internal queue. The only other place the m  
//tools/base/profiler/native/perfa/memory/memory\_tracking\_env.cc.

fr...@gmail.com <fr...@gmail.com> [#48](#)

OK here is the thread dump following instructions from [comment #46](#)

 **threaddump2.txt**  
250 KB [View](#) [Download](#)

al...@google.com <al...@google.com> [#49](#)

Sorry I made a mistake in the commands. Please run the following:

```
set confirm off
set pagination off
target remote localhost:1234
info thread
info address art::Thread::CurrentFromGdb
```

This last command will print something like Symbol "art::Thread::CurrentFromGdb" is at 0x77e4d10130 in a file compiled without debugging. copy the entire hex pointer (0x7

```
set $get_thread=<value copied from last command>
thread apply all -c p (((unsigned short*)(*))$get_thread())[1]
thread apply all where
```

I forgot to add the -c flag that causes the apply to continue even on unattached threads. Note that the pointer for art::Thread::CurrentFromGdb might be different when you run it again.

al...@google.com <al...@google.com> [#50](#)

Also please be sure to run the 'info thread' command too. We need that to know what the names of all of the threads are.

fr...@gmail.com <fr...@gmail.com> [#51](#)

OK, here you go.

 **threaddump3.txt**

```

<https://android.googlesource.com/platform/art/+/refs/heads/oreo-release/runtime/openjdkjvmti/events-inl.h#183>

It looks like we didn't transition to kNative before calling the events in oreo. This behavior shouldn't happen in latter releases. It's definitely fixed in pi.

yiyyang: Can we maybe meet up to discuss next steps. Working around this behavior in the agent might be rather difficult.

**fr...@gmail.com** <fr...@gmail.com> [#53](#)

Hi all - did that last thread dump help?

**al...@google.com** <al...@google.com> [#54](#)

Yes that was very helpful. It gave us what we needed to figure out what was happening.

**yi...@google.com** <yi...@google.com> [#55](#)

Thanks for the logs! We believe we've narrowed down the issue to a legacy bug in Android O (26), which your Samsung device is on. But just to double check, I believe you tried a Pixel 2 devic

**fr...@gmail.com** <fr...@gmail.com> [#56](#)

Yes, that is correct - I just tried it again on Pixel 2 emulator running 28. All worked appropriately.

**fr...@gmail.com** <fr...@gmail.com> [#57](#)

So I just tried the released AS 3.6 and the bug is still there...I guess fixing this is targeted for a later release?

**yi...@google.com** <yi...@google.com> [#58](#)

Hi, we have a theory of how we might fix this but without a local repro we can't validate that. I sent you a direct email earlier about sharing the app APK with us. Would you be comfortable do  
On the other hand we confirmed devices on Android P and later are not affected by this issue because the underlying bug was already fixed in the Android Runtime in P. Is there any way you c

**fr...@gmail.com** <fr...@gmail.com> [#59](#)

I might be able to get clearance to do that if you can assure me here that there won't be any de-compiling, reverse engineering, etc. You just need an .apk with debug, not release, correct?

How would I get it to you?

**yi...@google.com** <yi...@google.com> [#60](#)

I just shared a Google Drive folder with you. Only you and I have access to it (I may share it with coworkers to work on this bug). Yes, we need a debug APK in order to run profiler on it. We wic

**fr...@gmail.com** <fr...@gmail.com> [#61](#)

OK I dropped a debug apk in there, let me know if that works for you.

**yi...@google.com** <yi...@google.com> [#62](#)

Thank you very much for providing it!

**yi...@google.com** <yi...@google.com> [#63](#)

*Status: Won't Fix (Infeasible)*

Hi, it's been a while but here's where we're at. The root cause was a bug in Android O runtime and it was already fixed in later versions. At this point it's very difficult for Android Studio to get a
